Belderbos, R., Castellani D., Du, H., Lee G.H., (2023) Internal versus External Agglomeration Advantages in Investment Location Choice: The Role of International Connectivity of Global cities

# Research questions

Based on greenfield investment projects from fDi Markets 2003-2015,  
**6532** cities received at least one FDI in manufacturing activity

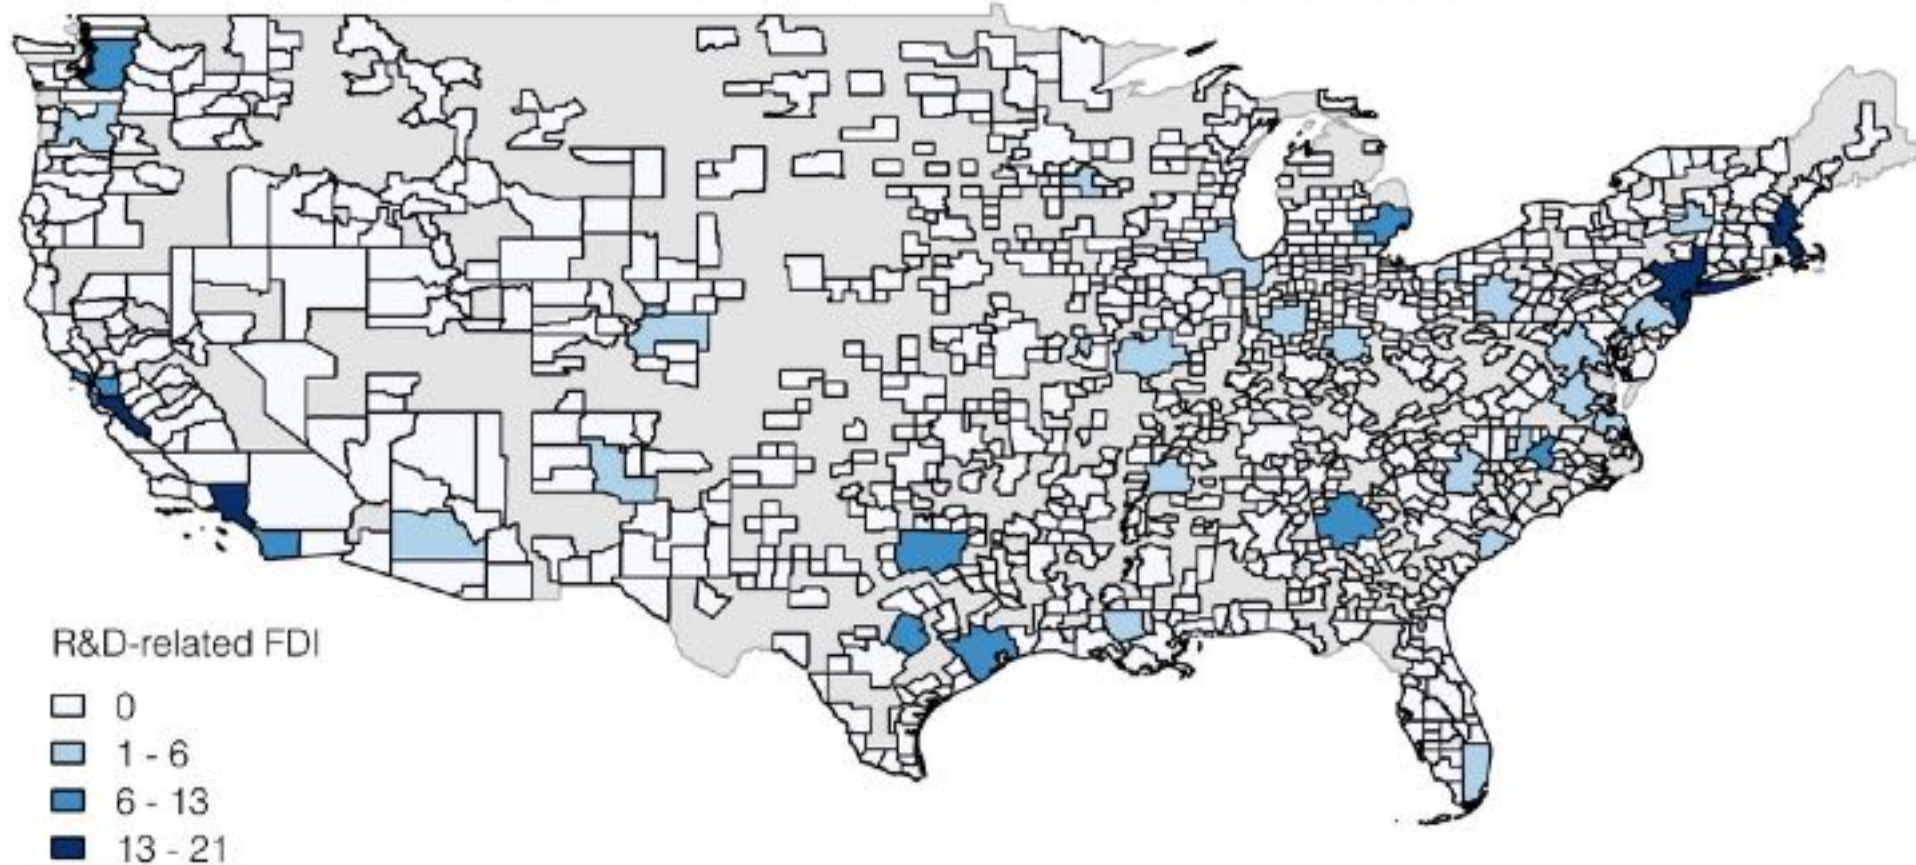

# Research questions

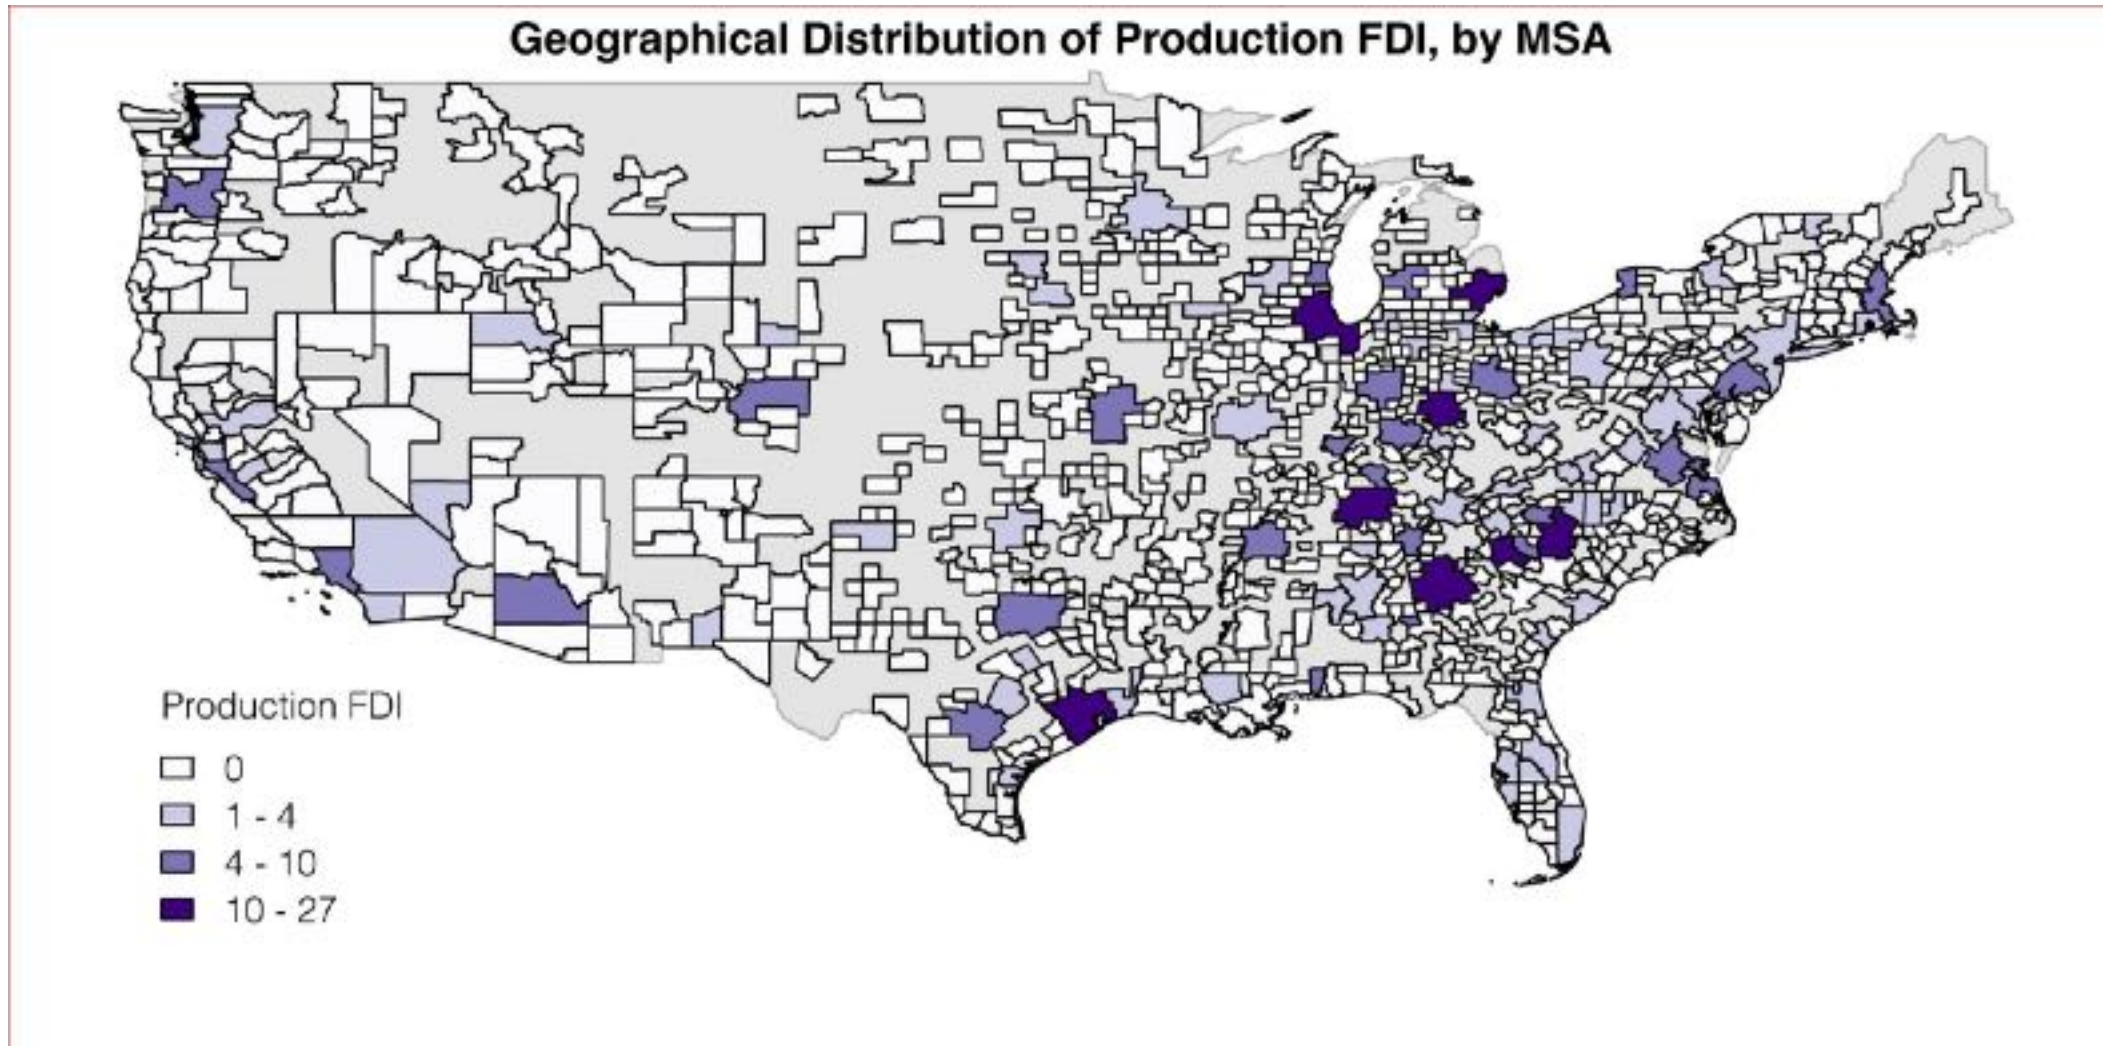

Based on greenfield investment projects from fDi Markets 2003-2015  
**707** cities received at least one R&D FDI (blue)

# Research questions

Geographical Distribution of R&D-related FDI, by MSA

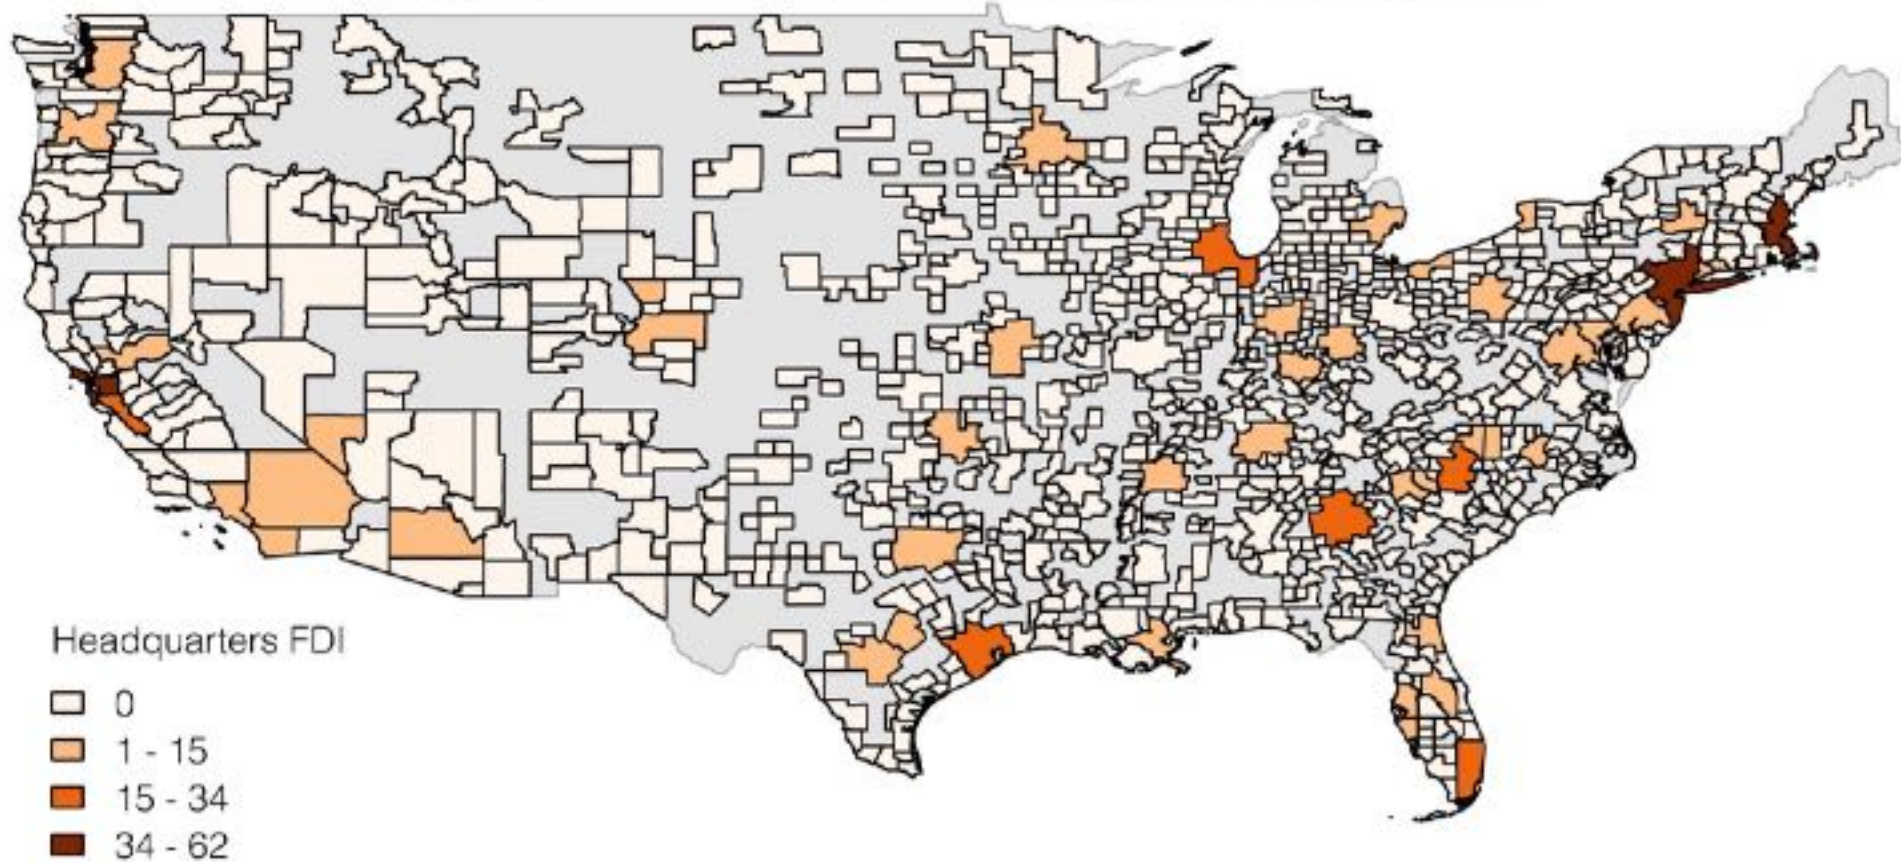

# Research questions

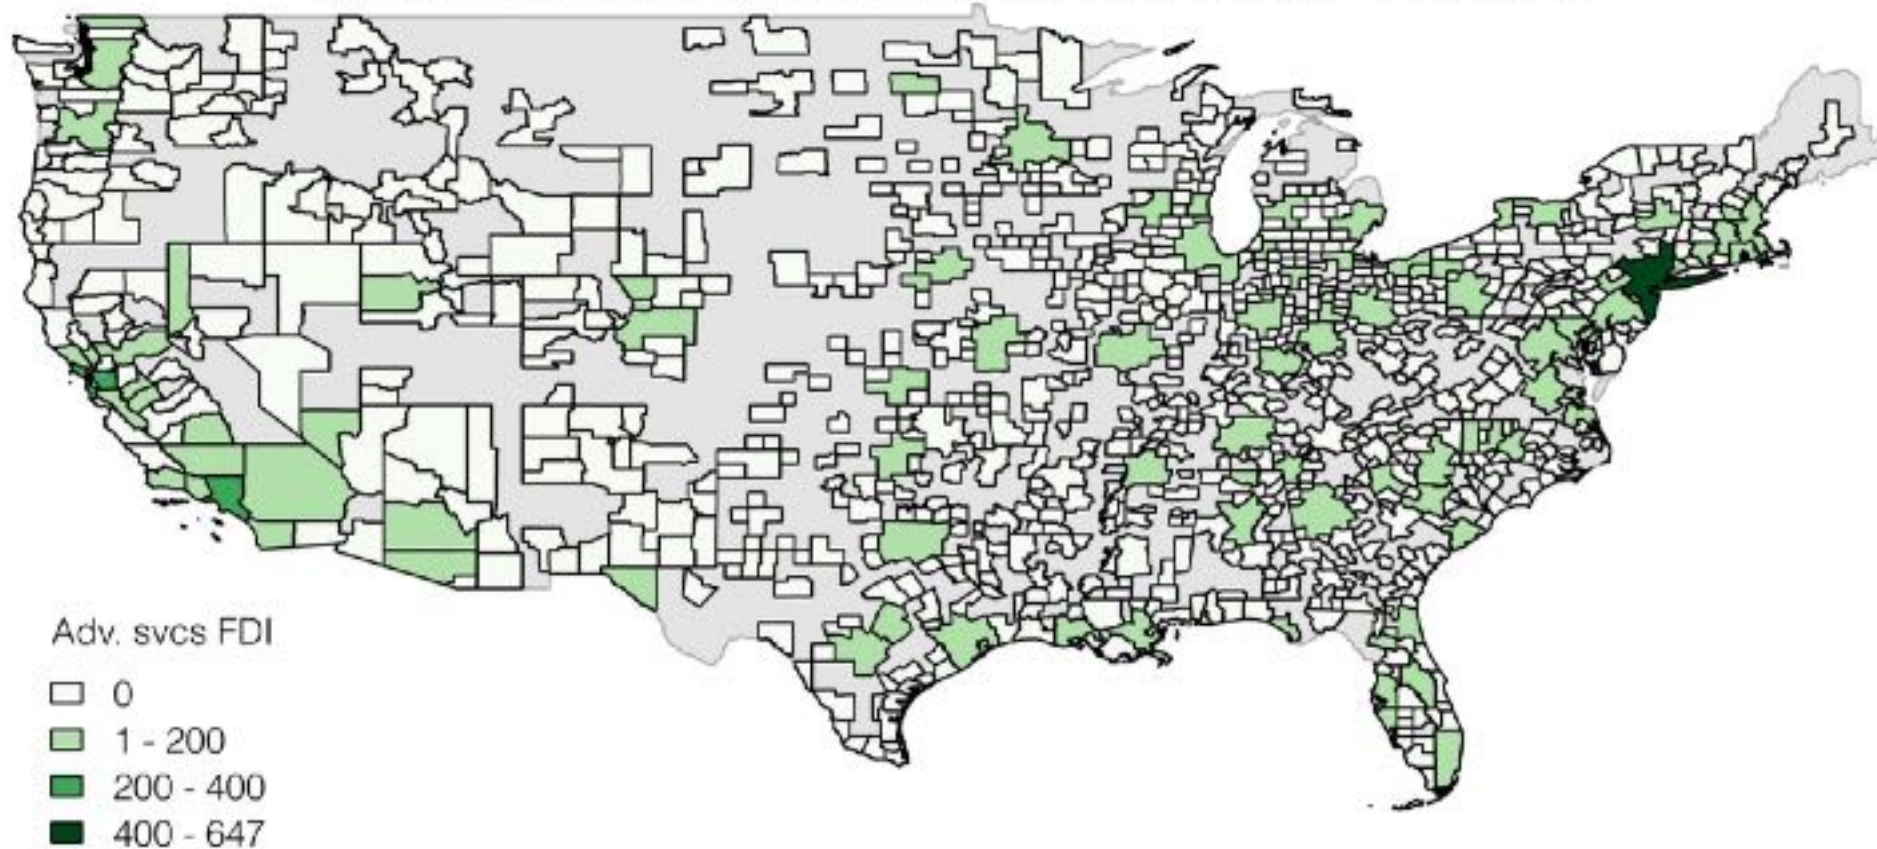

# Research questions

Geographical Distribution of Headquarters FDI, by MSA

# Research questions

Geographical Distribution of Advanced Services FDI, by MSA

# Research questions

- What are the factors affecting the location choice for MNCs activities?
- Do they differ across value chain activities?
- What is the appropriate geographical granularity for these decisions?

Building on recent research this presentation will focus on

- (global and local) connectivity
- agglomeration economies

# Connectivity and the location of MNEs

Where business comes to life

# Global connectivity and the location of MNE activity

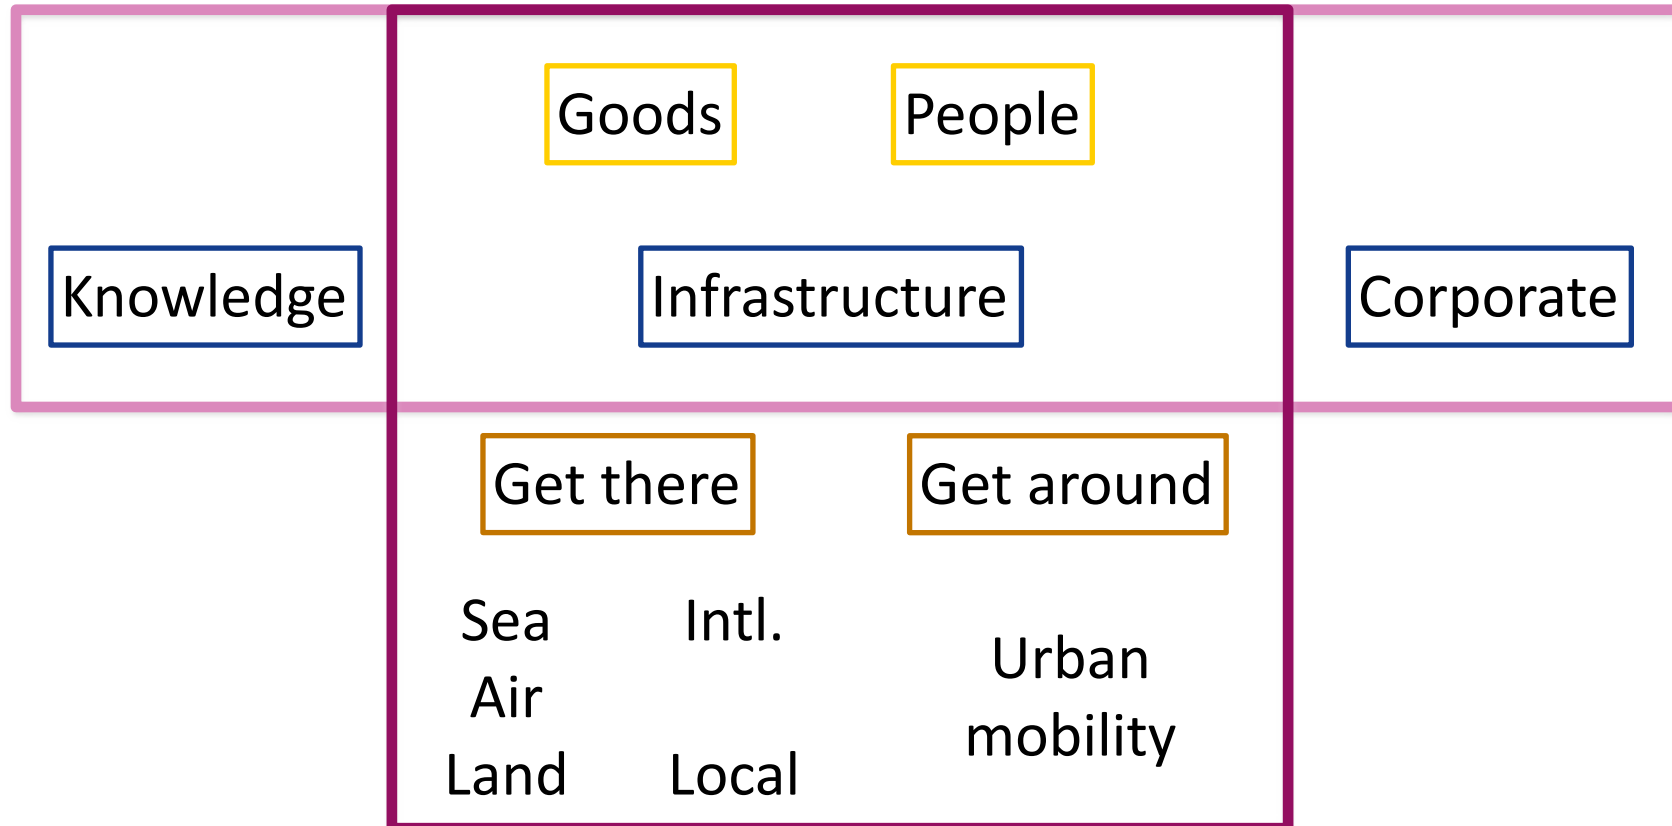

- International connectivity especially impacts MNE activity, because these firms are required to **orchestrate a geographically fragmented network of cross-border activities**, which need to be efficiently coordinated and connected across space
- To analyze the role of international connectivity in the location choices of MNE activities, scholars originally focused on **global cities and their features** (Goerzen et al., 2013)

# Connectivity

- Connectivity can be defined as the ease and intensity with which **people, goods, capital, and knowledge** flow across space (Bevearstock, 1999; Belderbos et al. 2017)
  - ▶ the **knowledge-centred** approach
    - a place cannot rely only on its own local knowledge base but also needs to encourage external knowledge inflows
    - dense local knowledge circulation and strong international connections to outside knowledge networks
  - ▶ **infrastructure** approach
    - focuses on the set of enabling systems and technologies that underpin border-crossing networks
  - ▶ the **corporate organisation** approach
    - relations between places are created primarily by firms pursuing transnational location strategies
    - connectedness through the networks of corporate service firms as a key trait of global cities

# Connectivity

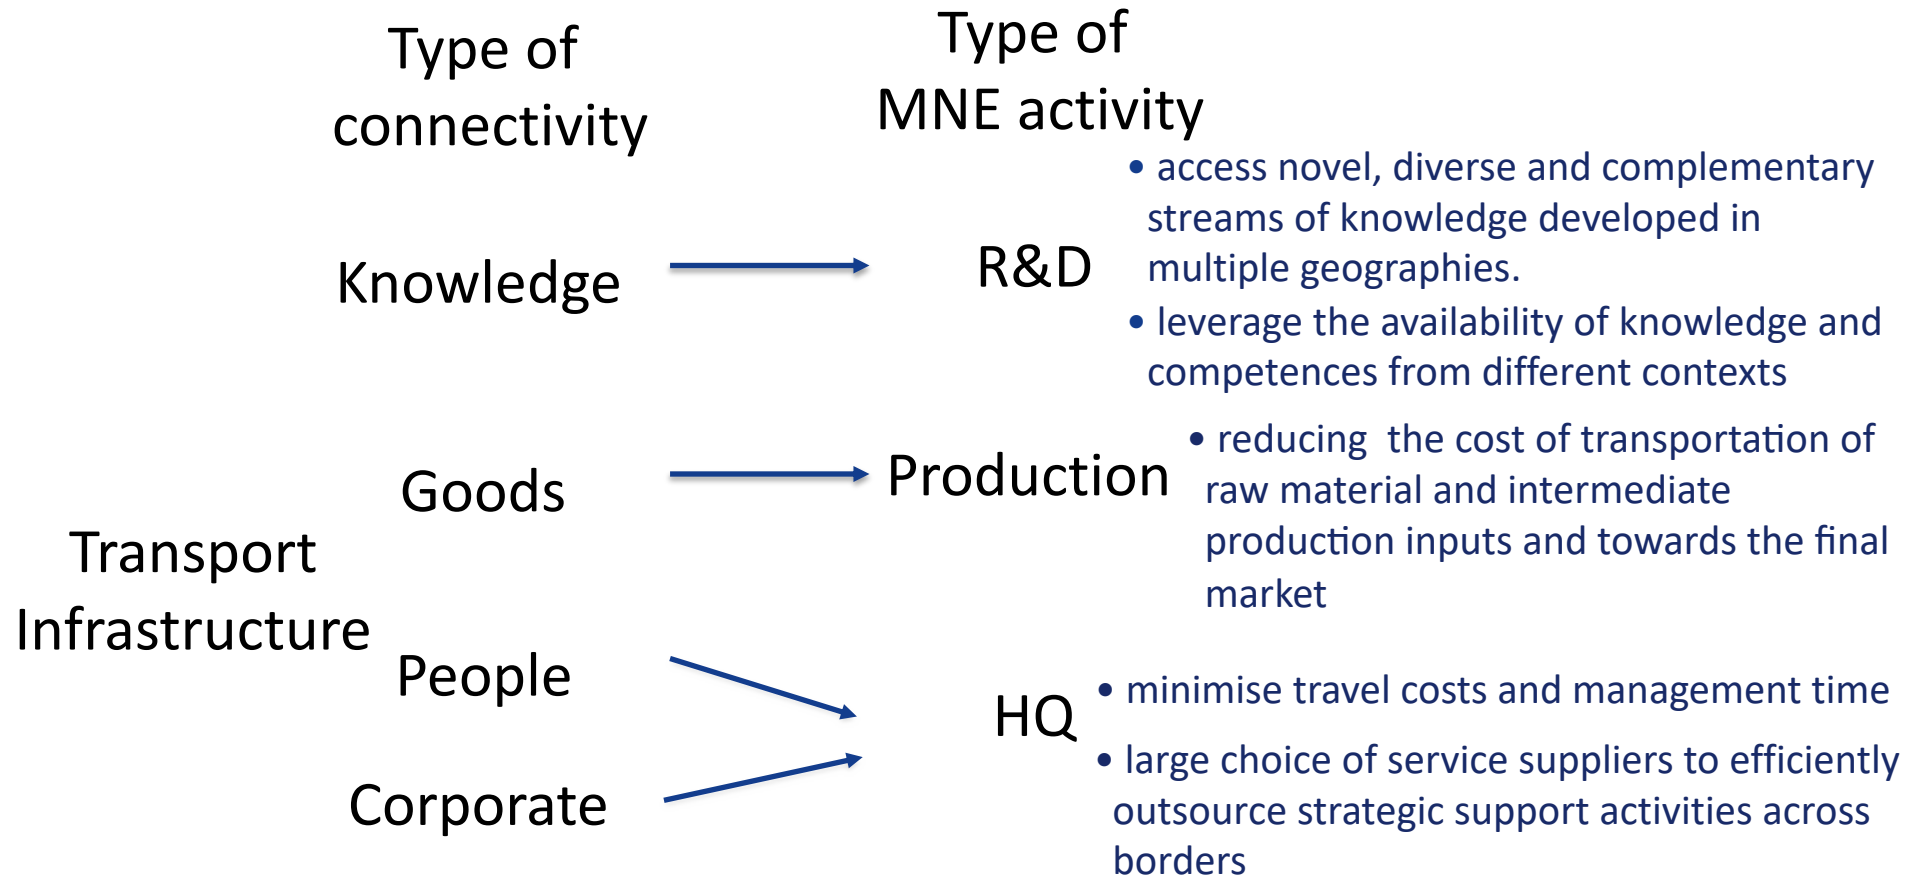

Castellani D., Lavoratori K., Perri A., Scalera V. (2019)  
“Connectivity and the Location of MNE activities across  
the value chain. Evidence from US Metropolitan Areas”

Ribaudo D., Castellani D., Zanfei A. (2019) “Getting there and around. The role  
of transportation infrastructures in MNEs’ location choices at the city-level”.

# International connectivity and the location of MNEs

Castellani, Lavoratori, Perri and Scalera (2019)

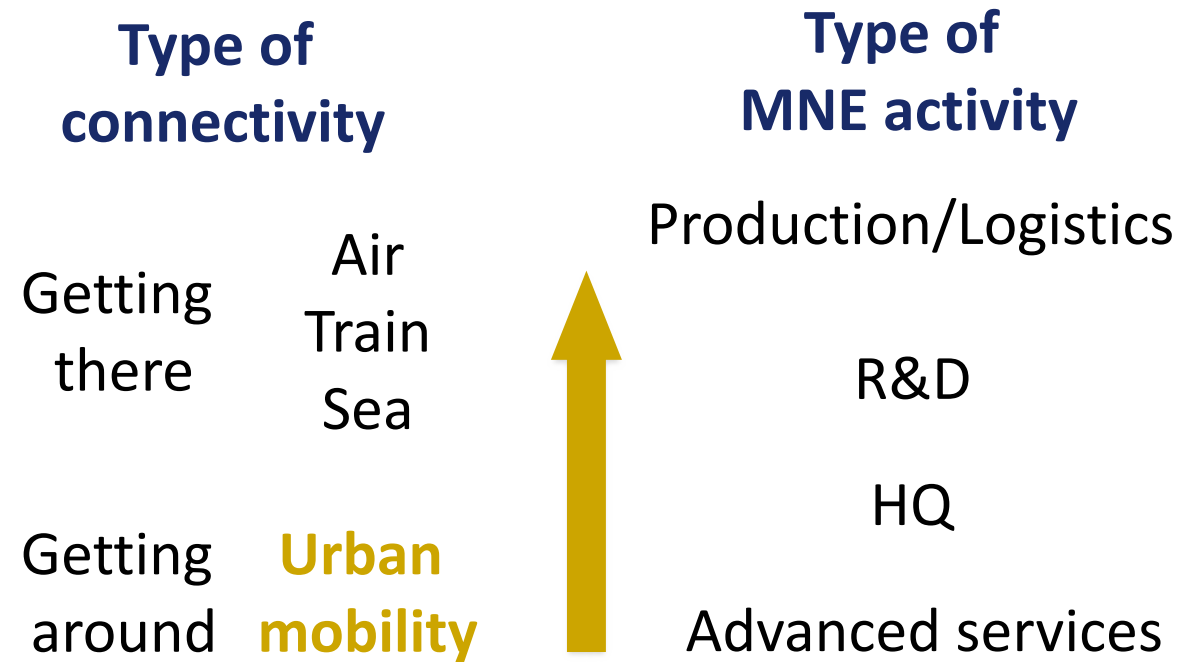

# Transport infrastructure and the location of MNEs

Ribaudo, Castellani, and Zanfei (2023)

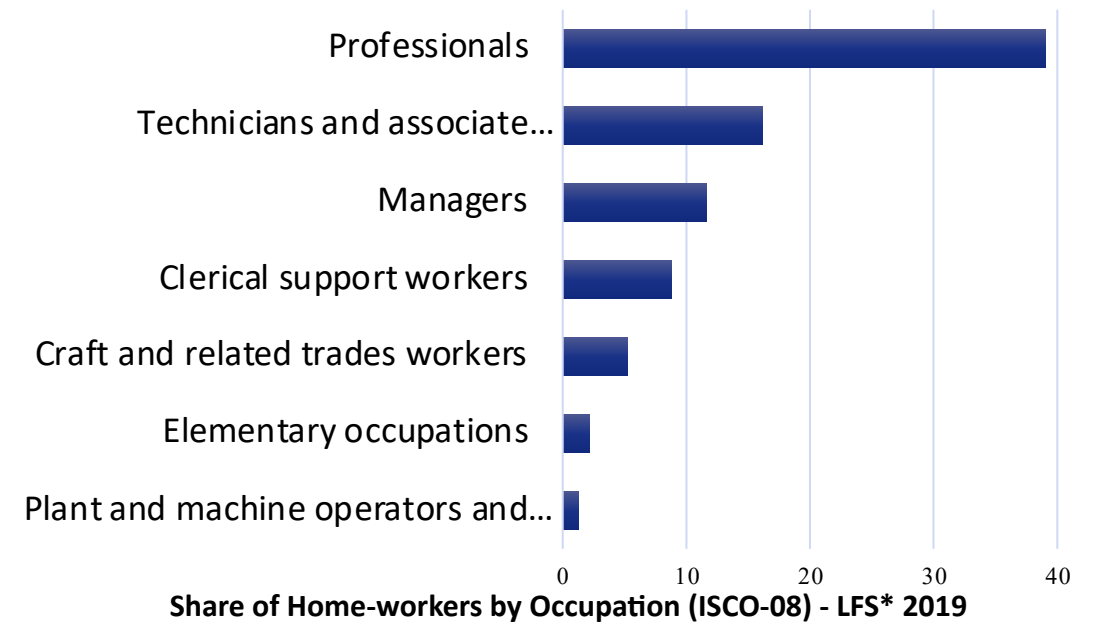

- ◉ Why (and how) does urban mobility matter for MNEs location decisions?
  - reduced **opportunity cost** for workers
    - commuting times reduce job satisfaction and require salary compensation
  - better **match** between firms and workers
    - lower commuting times allow firms to hire workers residing in (and workers to choose firms located in) a larger catchment area
  - **workers and firms differ** in the importance they attach to an effective urban mobility system
    - less important for younger and more educated workers, for more qualified jobs and in high-tech and innovative firms

# Transport infrastructure and the location of MNEs

Ribaudo, Castellani, and Zanfei (2023)

| Business Activity/Occupation | Age   | ISCED |
|------------------------------|-------|-------|

# Data

- Cross-border greenfield investments from FT's *fDi Markets* (2003-2014)
  - For each project we know
    - **Name** of the investing company and its parent
    - **City** where the investment take place and city of parent (with geographical coordinates)
    - Main **business activity** involved (e.g. production, R&D, sales & marketing, HQ, logistics, business services, ...)
    - **Industry**
  - We use the information on the destination city
    - for **70 cities** with data on Urban mobility (Ribaudo et al., 2019)
    - to geo-reference each project within US Core Based Statistical Area (CBSA) and we focus our analysis on **382 US Metropolitan Statistical Areas (MSA)** (Castellani et al., 2019)
- **Urban Mobility Tools UT-DAT (World Bank)**
  - which contains information on city's mobility characteristics

# Measuring transport infrastructure

## ◉ Getting around

- Average Time to Work
- Number of Public Urban Transport Vehicles (underground, bus, light railways)

## ◉ Getting there

- Number of passengers at national and international airports
- Number regional and commuter trains
- Distance to the airport
- Presence of a port

# Transport infrastructure and the location of MNEs

## Results: conditional logit

**Agglomeration economies  
and the location of MNEs**

# External agglomeration economies

## Collocating with other firms

- Marshallian and Jacobian externalities
  - Reduce firms' operating costs of search for labour and input providers and knowledge spillovers
- Congestion costs and competition effects may counteract
- Heterogeneity
  - Weaker firms benefit more from clustering
  - Benefits and costs weigh differently for different activities
- Same home-country and co-ethnic agglomerations
  - legitimizing effects
  - existing buyer-supplier relationships that are replicated abroad, a
  - information flows that reduce uncertainty
    - migrants have similar effects (Benfratello, Castellani and D'Ambrosio, 2023)

# Internal agglomeration economies

- Geographic collocation of different value chain activities owned by the same parent company
  - Economies of scale and scope in internal labor market
  - Access to intermediate inputs
  - Knowledge sharing
  - Easiest coordination
    - it avoids coordination of complex and dispersed organizational structures
      - Facilitate intra-firm flow of (tacit) knowledge and information between different units)
      - Reduce communication costs
- The propensity to collocate differ across pairs of activities
  - collocation of R&D and production have attracted most of the research

# Agglomeration economies and the location of MNEs activities

## External agglomeration economies

- derived from co-location **with other firms**

**disperse R&D activities**

## Internal agglomeration economies

- derived from **proximity (co-location) of different activities of the same firm**

**concentrate R&D activities**

# Internal agglomeration economies

Do R&D collocate with production activities?

- R&D and production may be attracted by rather different external factors (including external agglomeration economies), thus leading to dispersion
- There are benefits of collocation in terms of exchange of tacit knowledge
- Evidence is mixed
- The need/advantage from collocation can be very heterogeneous across firms and sectors
  - **firms' ability to coordinate geographically dispersed activities**
  - tacit vs. codified and science-based knowledge
  - degree of modularity
  - basic vs. applied

**Methodological challenges**

# Conditional logit

- Firm  $i$  chooses to locate in the location  $j$  which yields the highest expected profit, conditional on observable variables:

$$\pi_{ij} = V_{ij} + \varepsilon_{ij}$$

- where  $V_{ij}$  denotes profit that firm  $i$  derives from locating in  $j$ . The probability of locating in  $j$  can thus be expressed as:
- Assuming an extreme value distribution for  $\varepsilon_{ij}$ , yields the conditional logit model.  $P_{ij} \equiv \Pr(y_i = j) = \Pr(\pi_{ij} \geq \pi_{il}) = \Pr(\varepsilon_{il} - \varepsilon_{ij} \leq V_{ij} - V_{il}) \forall l \neq j$
- If error terms  $\varepsilon_{ij}$  are correlated across alternatives, CL is biased.

# Mixed logit

$$\pi_{ij} = \underbrace{\beta_i' x_{ij}}_{\text{random parameter}} + \varepsilon_{ij} \quad \pi_{ij} = \beta' x_{ij} + \underbrace{\mu_i' z_{ij} + \varepsilon_{ij}}_{\text{error component}}$$

- error component interpretation
  - it allows to model the degree of substitution among locations in a very flexible way
    - For example, if the cost of land increases in NYC, it is more likely that a firm relocates in London, than in ...
- random parameter interpretation
  - Not all firms assign the same importance to some location determinants
    - E.g. some firms may value high wages (i.e. high skilled workers, while others don't)

# Random parameters

$$\pi_{ij} = \beta_i x_{ij} + \epsilon_{ij}$$

- Normally, we estimate the mean of parameter  $\beta$ , assuming that it is the same across all observations
- One way to allow different  $\beta$  is to have interaction terms or sub-sample analysis.
- With random parameter models we estimate the mean and the variance of  $\beta$
- We can have various cases
  1. statistically **significant** mean / statistically **insignificant** variance
  2. statistically **insignificant** mean / statistically **insignificant** variance
  3. statistically **insignificant** mean / statistically **significant** variance
  4. statistically **significant** mean / statistically **significant** variance
- In cases 3 and 4 we have evidence of heterogeneous responses across firms (to location determinants)
- Note that in case 3 by looking at the mean only we would infer that our variable of interest is not important, while the statistically significant variance suggests that for some observations that variable is important

# Random parameters

- If we find evidence of heterogenous responses, we can explore the sources of such heterogeneity

## A. explain the variance

- refine the model specification by adding variables and/interactions
- e.g. Chung and Alcacer (2002) study MNE location decisions across states and find that firms heterogeneously value states' R&D activity. Adding several industry dummies, interacted with state R&D activity, leads the variance to become insignificant.

## B. predict firm-specific effects

- assuming a distribution for firm-specific effects allows to predict a vector of such firm-specific coefficients.
- this vector can be used as the dependent variable in a second stage (see Alcacer et al., 2018; Castellani and Lavoratori, 2020; Hornstein and Greene, 2012)

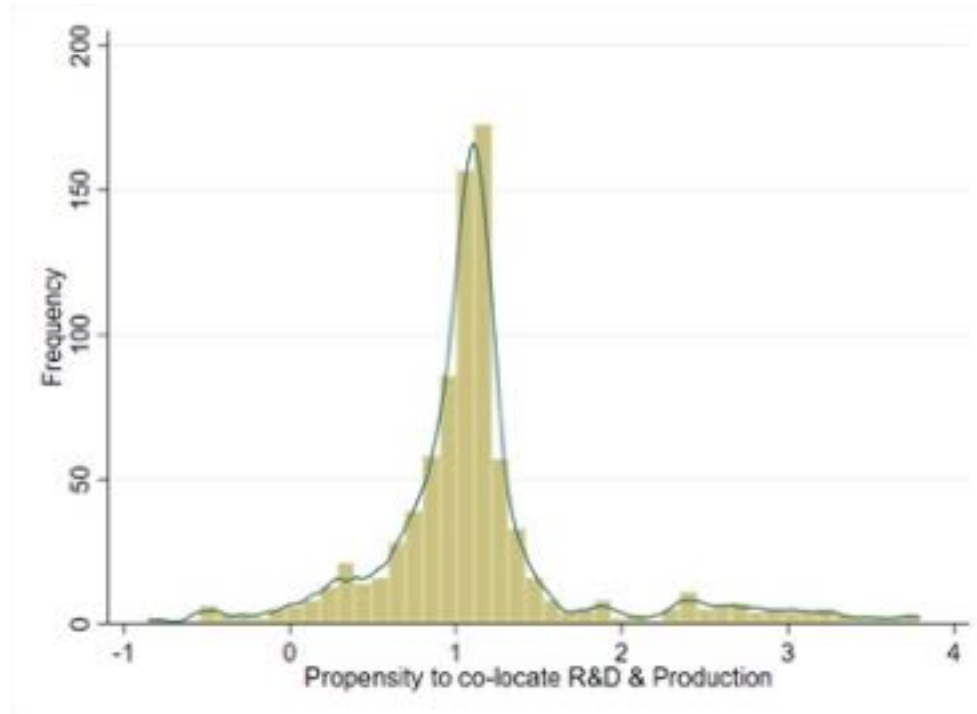

$$\hat{\beta}_i = \theta_0 + \theta_1 Z_i + u_i$$

# Predicting firm-specific effects

Castellani and Lavoratori (2020)

|                                   | Mod. 1   |          |           |          |
|-----------------------------------|----------|----------|-----------|----------|
|                                   | Mean     |          | Std. Dev. |          |
|                                   | (1)      |          | (2)       |          |
| Intra-firm co-location city level |          |          |           |          |
| Prior firm Production             | 1.111    | [0.0000] | 1.8733    | [0.0000] |
|                                   | (0.1774) |          | (0.2348)  |          |

- Castellani and Lavoratori (2020) find that the propensity to co-locate R&D with production is positive on average positive, but highly heterogenous across firms
- They predict the vector of firm-specific coefficients and regress it on a large number of firm characteristics
- The advantage of this method is that it allows to simultaneously account for a large set of moderating factors, which would not be feasible with neither sub-sample, nor with interactions

# Explaining firm-specific effects

## Castellani and Lavoratori (2020)

**Table 3** Uncovering the sources of heterogeneity in the propensity to co-locate production and R&D, second-stage OLS regression.

| OLS                           | Propensity to co-locate R&D and production |                                  |        |                                  |                                  |                                  |                                  |                                  |                                  |                                  |                                  |

# Internal versus External Agglomeration Advantages in MNEs Location Choice: The Role of International Connectivity

Belderbos R., Castellani D., Du H., Lee G.H

Where business comes to life

# Research questions

- Connectivity
  - better connected cities are more attractive

**Are agglomeration economies less important if the city is better connected?**

- Agglomeration economies
  - cities with activities of other MNE activities are more attractive (external)
  - cities where my firm has invested in the past are more attractive (internal)

**Are external agglomeration and internal agglomeration substitute in the same location**

# The paper in a nutshell

- Advantages of internal and external agglomeration are reduced in importance due to the international connectivity of a location
  - international connectivity weakens the role of **internal agglomeration more** than the role of external agglomeration
  - the moderating effect is **stronger for service-based** than for production-based activities
- Internal and external agglomeration benefits **weaken each other** in the same location
- We provide empirical evidence based on cross-border investment data at the city level across six value chain activities

# Hypotheses

- International connectivity, temporary proximity and internal agglomeration
  - Temporary proximity
    - mobility of employee and manager for periodic coordination and exchange of knowledge and information
    - builds on organizational proximity (e.g. communities of practice within the MNC)
    - is easier in cities that well connected
    - can act as a coordinating device that reduces spatial transaction costs

**H1a: The international connectivity of a location negatively moderates the influence of internal agglomeration economies on the probability that the location is chosen for investment by an MNC**

- International connectivity and external agglomeration
  - allows knowledge exchanges between firms at greater distance
  - allows access to intermediate inputs, and specialized labor at greater distance

**H1b: The international connectivity of a location negatively moderates the influence of external agglomeration economies on the probability that the location is chosen for investment by an MNC**

# Hypotheses

- Temporary proximity is a relatively more effective coordination mechanism in *service-related* activities
  - which are largely immaterial, embodied in specialised professionals and inherently more mobile.
  - this reduces the need for permanent physical proximity,
    - as services can be supplied from a distance and occasional face-to-face meetings can be efficient means of coordination and complement long-distance knowledge sharing
- *Production-related* activities rely more on local material assets
  - This reduces the potential for international connectivity to provide the benefits from permanent geographical proximity

**H3: The negative moderating effect of international connectivity is stronger for service-related value chain investments than for production-related value chain investments**

# Hypotheses

- External agglomeration are associated with local knowledge exchange
  - Such greater local knowledge exchange renders the firm a stronger source of outgoing knowledge spillovers to rival firms in the local agglomeration
- Firms benefitting from internal agglomeration advantages are likely to put more emphasis on preserving their knowledge generated and shared internally.
  - They have relatively less to gain from knowledge spillovers related to external agglomeration, and the internal orientation may also render the firm less open to benefit from agglomeration externalities
- When locations offer significant external agglomeration benefits, firms are better off not seeking to increase internal agglomeration in the same location

**H3: Internal and external agglomeration are substitute** (and they weaken each other's influence on the probability that a location is chosen for investment by a MNC)

# Data

## Cross-border investments

- fDi markets database on cross-border greenfield investments, 2003-2016
- Six types of value chain activities in 40 industry sectors
  - **Headquarters:** HQ, Shared Services Centre
  - **Logistics:** Logistics, Distribution & Transportation, ICT & Internet infrastructure
  - **Manufacturing** Manufacturing, Recycling
  - **R&D:** Research & Development, Design, Development & Testing, Technical Support Centre
  - **Sales:** Customer Contact Centre, Maintenance & Servicing, Retail, Sales, Marketing & Support
  - **Services:** Business Services, Education & Training
- Investments during 2008-2016
  - Window of five years of prior investments to construct agglomeration measures

| Value chain activity       | Number of investments | Percentage |
|----------------------------|-----------------------|------------|
| <i>Production-related:</i> | 4,395                 | 10.30      |
| Manufacturing              | 1,741                 | 4.08       |
| R&D                        | 2,654                 | 6.22       |
| <i>Service-related:</i>    | 38,241                | 89.70      |
| Sales                      | 22,733                | 53.32      |
| Services                   | 10,947                | 25.68      |
| HQ                         | 2,866                 | 6.72       |
| Logistics                  | 1,695                 | 3.98       |
| <b>Total</b>               | <b>42,636</b>         | <b>100</b> |

# Data

## Global Cities

- 75 worldwide global cities provided by Mastercard “Worldwide Centres of Commerce Index” (2008)
  - Ranked on 5 dimensions: human capital, information exchange, political and legal stability, livability, economic stability
- **42,636** cross-border investments in **71** global cities by **19,275** firms from **97** home countries
  - Account for **42.2%** of worldwide FDI projects observed in the FDI market database in the period, 2008-2016

# Variables and Model

## Dependent variable

- Binary variable indicating in which global city the cross-border investment is made

## Key explanatory variables

- Internal agglomeration
  - The number of focal firm's prior investments in the 5 value chain activities other than the focal value chain activity of investment in the global city
    - Prior investments weighted by a colocation advantage parameter: different pairs of value chain activities have different degrees of colocation benefits
  - Same value chain collocation/expansion: the number of prior investment in the same value chain activity as the focal investment
- External agglomeration
  - The number of prior investments in the same value chain activity as the focal investments made by all firms in the same industry in the global city
- International Connectivity
  - A composite measure averaging the indexed scores of three dimensions of connectivity: cities' producer services connectivity, international airport passenger traffic flows and international knowledge connectivity

# Variables and Model

## Control variables

- Distance measures
  - Language distance between home and host countries
  - Geographical distance between home and host cities
  - Cultural distance based on four Hofstede cultural dimensions
  - City-specific: GDP, GDP growth, population density, wage level, patent intensity, the number of world top 500 universities, net migration rate
- Country-specific: Corporate tax rate

**Empirical model:** Conditional (and Mixed – random coefficient) Logit Models

# Range of elasticities - by connectivity

## a. Effects of Agglomeration at different levels of international connectivity

| International connectivity: | Elasticity w.r.t.<br>Internal agglomeration | Elasticity w.r.t.<br>External agglomeration | Int./Ext.           |
|-----------------------------|---|---|---------------------|
| Mean - 2SD                  | 2.147***<br>(0.000)                         | 0.916***<br>(0.000)                         | 2.344***<br>(0.000) |
| Mean                        | 1.582***<br>(0.000)                         | 0.828***<br>(0.000)                         | 1.911***<br>(0.000) |
| Mean + 2SD                  | 1.015***<br>(0.000)                         | 0.739***<br>(0.000)                         | 1.373***<br>(0.000) |

- Elasticities for both internal and external agglomeration decrease as connectivity increases from low to high level
- At all levels of agglomeration, magnitude of decrease is higher for internal agglomeration than external agglomeration

# Range of elasticities - by agglomeration

## b. Internal (external) Agglomeration at different levels of external (internal) agglomeration

| Ext. agglomeration level: | Elasticity w.r.t.<br>Internal agglomeration | Int. agglomeration level: | Elasticity w.r.t.<br>External agglomeration |
|---------------------------|---|---------------------------|---|
| Mean - 2SD                | 3.076***<br>(0.000)                         | Mean - 2SD                | 0.874***<br>(0.000)                         |
| Mean                      | 1.582***<br>(0.000)                         | Mean                      | 0.828***<br>(0.000)                         |
| Mean + 2SD                | 0.098<br>(0.640)                            | Mean + 2SD                | 0.781***<br>(0.000)                         |

- Elasticity of internal (external) agglomeration decreases as the level of external (internal) agglomeration increases -> Trade-offs in MNC's VC investment decision with regard to agglomeration factors
- Effect of internal agglomeration turns insignificant at high level of external agglomeration

# Summary

- Agglomeration economies and international connectivity are characteristics that make cities attractive for MNC deciding to locate abroad
- Nevertheless, our results suggest that it would be misleading to think that more of all would be beneficial (too much of a good thing)
- Agglomeration economies are more beneficial in poorly connected cities than in highly connected ones
  - This is particularly true for internal agglomeration economies deriving from collocation of different activities of the same firm. International connectivity allows for temporary proximity that can substitute for collocation
- External and internal agglomeration are substitutes
  - Cities can choose whether to foster the creation of clusters by targeting several firms, or focus on encouraging further embeddedness of MNC that has previously located (nurturing existing investors vs. attracting new ones)

# Concluding remarks

**Henley**  
Business School

UNIVERSITY OF READING

Where business comes to life

# Concluding remarks

- connectivity is emerging as a key driver of the location of MNE activities
  - well connected locations can attract MNE activities, even lacking agglomeration externalities benefits
- heterogeneity in connectivity and value chain activities
- the role of intra-city connections
  - IB and (economic/transport) geography complementary views
- geographical granularity of location
  - Zoom-in / Zoom-out
- connectivity and digitalisation
